

Plastic Connections

I claim as my invention plastic connections. They are plastic side-frames and panel inserts. Plastic side-frames are one solid piece that measures 72x30x13.5. They are made of acrylic that are adjustable and can be assembled and disassembled flat in seconds without the need of tools. The side-frames have five 12' long open slots on one side of its frame.

The slide-in panels are one solid piece of acrylic that measures 30x13.5x1 and has two 12' long open slots on both sides.

When two 72" foot side-frames are put together with five slide-in panels a five level storage unit is formed for fast easy storage of almost any kind of lightweight items.

Thank you
